

Portfolio Manager Commentary - September 30, 2022

Global Markets Review

After a relief rally from mid-July to mid-August, global equity markets gave up all gains and finished the third quarter with negative returns. Both equity and bond markets continued to suffer from decade-high inflation and central banks' aggressive monetary tightening. Volatility remained high across all major asset classes, while the recessionary risk has been rising as well. For the three-month period ended September 30, 2022, the MSCI World Index fell by 6.1%. Consumer Discretionary was the only sector that registered positive returns (+0.3%), while Communication Services was the bottom-performing sector (-12.9%). In North America, the S&P 500 dropped by 4.9% with Consumer Discretionary also the best-performing sector. The S&P/TSX Composite lost 1.4%, boosted by Industrials. In Europe, the STOXX 600 was down 4.2% for the third quarter of this year. Major European indices also registered negative returns. Italy' FTSE MIB was the best-performing index (-2.5%). France CAC 40 and the U.K. FTSE 100 were down by 2.5% and 2.8%, respectively. Switzerland, Germany, and Spain lost 4.3%, 5.2%, and 8.3%, respectively.

Inflation has remained stubbornly high, which continues to challenge global economic growth. Energy prices have come down from the peak. Meanwhile, global supply chain disruptions continued easing. However, ripples from geopolitical tensions between Russia and Ukraine still linger. While a variety of key economic measures remained sound during the third quarter, deterioration in other data suggested an economic slowdown. August CPI pointed at 8.3%, a further deceleration from the peak in June, but this elevated inflation level would be unlikely to slow the pace of further aggressive monetary tightening. Rising inflation is eroding real wage growth, while unemployment rates continue to see sequential decline to pre-pandemic lows. Manufacturing PMI entered September at 50.9, which has largely trended down since its peak in March 2021. Bond market also sold off during the quarter. The U.S. Treasury market kept rising sharply in response to the inflation overshoot and monetary tightening, while the 2-year and 10-year Treasury spread remained in below-zero territory during the quarter. During the last few days of September, the newly formed U.K. government announced a fiscal package including a tax cut program that raised concerns of adding inflationary pressure to the economy. As a result, the budgetary announcement accelerated the market sell-off, sending GBP to an all-time low versus USD and the gilt yields surged accordingly. With most equity markets falling in Q3, Consumer Discretionary and Consumer Staples showed relative resilience thanks to strong consumer spending and still-low unemployment. Meanwhile, Energy stocks were boosted by solid Q2 results and strength in natural gas prices but were offset by weak oil prices during the quarter. Rate-sensitive sectors such as Real Estate generally underperformed amid the high interest rate environment.

Central banks in developed economies continued to deliver more hawkish stances of their monetary policy to combat inflationary risks. This quarter witnessed two consecutive 75-basis-point interest rate hikes—at the July and September Federal Open Market Committee (“FOMC”) meetings—to the 3.00%-3.25% range. As the Fed reaffirmed its commitment to fighting inflation, the Fed funds futures market is pricing in another 140 basis points of tightening by year-end. This includes another two possible 0.75% hikes at both November and December meetings. Along with rate increases, the Committee also confirmed the full speed of balance sheet reduction at a pace of \$95 billion a month starting from September.

The Bank of Canada (BoC) delivered even more aggressive policy stances to tame inflation by raising its policy rate by 100 at the July meeting and 75 basis points at the September meeting. This sent Canada's overnight policy rate to 3.25%, bringing the cumulative hikes so far this year to 300 basis points, the fastest tightening pace since the mid-1990s. The statement communicated that “the policy rate will need to rise further”. Higher interest rates will test Canadian households' ability to service their debts, as the housing market extended its cooldown during the third quarter.

The European Central Bank (ECB) started raising its benchmark interest rate during the quarter: 50 basis points in July, followed by 75 basis points in September. With the current benchmark interest rate at 1.25%, the ECB President Lagarde signaled that policy rates remain far below levels that ensure the return of 2% inflation. Given a deteriorating inflation picture in Europe, including rising wage growth and hefty energy prices, further rate hikes over the next several meetings should be expected to slow demand and curtail persistent inflationary pressure. Meanwhile, the Bank of England (BoE) voted to lift the policy rate by two consecutive 50 basis points hikes in August and September to 2.25%. However, the newly announced fiscal measure including a large amount of tax cuts drew global criticism, leading to a historic U.K. gilt and British pound sell-off. The BoE was forced to postpone the planned commencement of its gilt selling and begin temporary purchases of long-dated bonds in order to calm the market turbulence. Rating

agencies Fitch and Standard & Poor's downgraded the outlook for the country's credit rating to reflect their lower confidence in the U.K. financial market and the policy framework.

Visibility on inflation outlook is low. Some evidence suggests that components of CPI have shown signs of decline in the U.S. at the end of Q3. Food, housing, and transportation account for the largest portion of the recent CPI spike. Lower oil prices during the three-month period have pulled transportation costs lower. Falling grain prices from the peak should also bode well for a cooldown in food CPI component. However, Shelter inflation could remain higher and longer, as rent increases have been accelerating, especially on existing leases. In Europe, energy costs continued to be the top contributor to inflation. Nord Stream 1, whose gas supply capacity accounts for over 10% of European demand and over 50% of Germany's demand, was shut down for maintenance in July. It came onstream temporarily before Russia closed it again after several leaks were found. This put further pressure on the power generator. Countries such as Spain and Portugal were forced to cut VAT rate on electricity bills to tackle soaring energy prices. In short, inflationary pressure and associated geopolitical tensions are more problematic in Europe than North America.

Looking forward to the rest of 2022, the global economic slowdown should persist, and broad markets should continue to experience high volatility until a less-aggressive Fed pivot occurs. There are early signs of peak inflation, but this is not sufficient to stop global monetary tightening. Rising inflation has weighed on corporate margins and earnings growth. With still-high inflation, aggressive monetary tightening, and unresolved geopolitical tensions, we expect a further multiple compression across all sectors after the Q3 earnings season, but valuations of some companies are at levels that are historically attractive. Therefore, in response to the ongoing market turbulence, we are positioning our portfolios tilted towards more defensive names. We continue to favor high quality companies that demonstrate low sensitivity to rate hike cycle, sustainable earnings growth, and reasonable valuations. Regarding country exposure, we still favor U.S. and Canada over Europe, with mounting risks for European households and business tied to more severe inflationary pressure and geopolitical tensions. To take advantage of market volatility and cushion against further market decline, we have also increased our call options overwrite levels.

Technology Sector Review & Outlook

The technology sector continues to be negatively impacted by the pace of rising yields and increasing interest rate volatility, which has led to a valuation re-rating. Despite this we believe the fundamentals in the technology sector remains solid; enterprise and consumer demand driving top line growth and cash flow generation with innovation expanding market opportunities. We believe a rising rate environment shifts risk premia towards cash flow generating firms and those that return capital in the form of dividends and share buybacks. Our portfolio is well positioned to benefit from these factor rotations given our barbell approach in actively managing over weights on growth and value styles and our preference for investing in cash flow generating tech companies versus unprofitable ones. In addition, our call writing strategy allows us to harvest volatility risk premia from our portfolio.

Global IT spending is expected to grow 3% to \$4.5 trillion in 2022 according to Gartner. Growth is expected to be driven by software (up 10% Y/Y) driven by demand for customer service, digital commerce tools, human capital management and enterprise resource planning. IT services is projected to grow 6% to \$1.3 trillion driven by outsourcing and consulting as companies embrace digital transformation. Data center spending is projected to grow of 11% in 2022 as providers accelerate data center build out given the increasing demand for cloud computing and resumption of enterprise data center expansion. Global shipments of devices (PCs, tablets and mobile phones) is expected to decline 7.6% in 2022 according to Gartner. The PC market is expected to experience the steepest decline of all devices segments this year, down 9.5%. High inflation, currency fluctuations, supply chain disruptions and recessionary pressures have lowered business and consumer demand for devices across the world and is set to impact the PC market the hardest. In Q3 PC shipments declined 20% year-over-year, according to Gartner, which is the steepest decline since the mid-1990s.

The Global semiconductor market is projected to grow 7% to \$640 billion in 2022 according to IC Insights. Growing uncertainty over chip demand, along with potential inventory buildups at original equipment manufacturers, supply chain shortages and lead times provides an unfavorable environment for semiconductor manufacturers. The US is moving to curb semiconductor technology transfer to China – companies will require licenses to export high-performance chips as well as tools/software/manufacturing process that aid in the design and manufacture of high-performance chips. Despite the headwinds of the new export restrictions, US chipmakers could still take relief from the \$52 billion in federal investment to boost domestic semiconductor production under the CHIPS Act and the tax-credit plan for facilities envisaged by the FABS Act.

Overall, the technology sector remains a structural growth story with valuations becoming more attractive. While recessionary pressures are headwind to the sector in the near-term, over the long-term the digital transformation opportunity, which is underpinned

by enabling technologies such as cloud, hyper connectivity (e.g. 5G), digital media, e-commerce, payments and intelligent automation, provides many avenues for growth. Disruptive emerging technologies, such as artificial intelligence and quantum computing, are expected to reshape business models and drive economic value add in the global economy. Stocks in our portfolio are uniquely positioned to benefit from this growth given their respective market position in the products and services they offer as well as degree of innovation that enhances competitive moats.

Portfolio Review

Brompton Tech Leaders Income ETF (the "Fund") was down 5% in Q3 2022 versus the S&P 500 Equal Weighted Information Technology Index down 4%.

The Fund's overweight exposure to software lagged the performance of benchmark holdings. Fortinet was the only top performer, up 0.9%.

The Fund was overweight technology-related sub sectors such as interactive media and internet media which underperformed relative to the benchmark with holdings in Alphabet (down 12%). During the quarter we exited our position in Meta given the idiosyncratic risks and recessionary headwinds which skewed the risk/reward to the downside.

An underweight exposure to semiconductors detracted from the Fund's performance relative to benchmark holdings. This was mainly attributed to our holdings in ASML which was down 15%.

The Fund was underweight IT services with performance ahead of the benchmark. Our holdings performed relative to the benchmark; our weighting tilt drove the outperformance.

The Fund was underweight hardware with performance ahead of the benchmark given our holding in Apple, which was down 12%. An underweight exposure to electronic equipment outperformed benchmark holdings. Our top performer, Keysight was down 4%.

The Fund has changed its technology benchmark from the S&P Information Technology Index to the S&P Equal Weight Technology Index. The S&P Equal Weight Technology Index tracks the performance of information technology companies included in the S&P 500 Index on an approximately equal weight basis. The S&P Information Technology Index, a sub-index of the S&P 500 Index, tracks the performance of information technology companies on a market cap weighted basis. Since the Fund also invests on an approximately equal weight basis the Manager believes that the S&P Equal Weight Technology Index provides a more comparable benchmark to assess relative performance of the Fund.
